Technical Specifications (In-Cash Procurement)

Hot Cell Complex - Building interfaces and cost optimization

This document aims at specifying two transverse activities to be performed in parallel:
1 - Interfaces management: review of the input data for building design activities, elaboration of the Interfaces Sheets between the building (PBS62) and the systems,
2 - Cost optimization: continuous effort to minimize the overall cost of the Hot Cell Complex, prevention of contractual claim regarding the Hot Cell Building design activities

16 APPENDIX: MAIN FEATURES OF THE HOT CELL COMPLEX ..............15
1 Purpose

This document aims at specifying two transverse activities to be performed in parallel for the Hot Cell Complex design activities:

1 - **Interfaces management** which corresponds to:
   - review of the input data for building design activities,
   - tracking of the Request For Information between the Engineering contractor and IO,
   - elaboration of the Interfaces Sheets between the building (PBS62) and the systems,

2 - **Cost optimization** which corresponds to continuous effort to minimize the overall cost of the Hot Cell Complex, covering but not limited to the building, and covering the full duration of the present contract.

2 Scope

The scope includes the overall Hot Cell Complex, including the building and the processes, in particular the Hot Cell Remote Handling System, the Radwaste process, the Port Plug Test Facility and the air Detritiation System.

The Hot Cell Facility is described in [ITER_D_L9V43M - Functional description of the Hot Cell Building](#). The Radwaste facility is described in [ITER_D_L5G67Y - HCC TF - Functional description of the Radwaste Building](#).

To be noted that the Hot Cell layout has changed in 2016 (see figure below). This is the reason why all existing Interface Sheets between the building and the systems will have to be updated.

![Figure 1 Level L1 of the 2016 Design of the Hot Cell Complex.](#)
The table in appendix summarizes main features of the Hot Cell Complex, illustrating the level of complexity and the required skills.

3 Definitions

For a complete list of ITER abbreviations see: ITER Abbreviations (ITER_D_2MU6W5).

4 References

Acronyms:
- C-R: Contractor Responsible. See Contract specifications for definition of duty.
- C-TRO: Contractor Task Responsible Officer. See Contract specifications for definition of duty.
- IO-RO: ITER Organization Responsible Officer. See Contract specifications for definition of duty.
- ICS: Interface Control Document
- IS: Interface Sheet
- PBS: Project Breakdown Structure

5 Estimated Duration

The contract duration shall be one year and shall commence after the official start date and upon the mutual agreement of both parties. It is envisaged that the services shall be performed on-site at IO.

6 Work Description

6.1 Context

Two types of activities are being performed in 2016 / 2017 aiming at designing the Hot Cell Complex and answering to the French regulator:
- Design activities regarding the building and the processes located within the building,
- Safety analysis based on the Hot Cell Complex design.

One major contract has been placed for the Hot Cell building engineering activities (technical specification at the link ITER_D_SW5UFF - Technical Specification Hot Cell Complex - Building Engineering Contract), while series of contracts have been launched in order to study the Radwaste and Remote Handling Systems located within the Hot Cell Complex.

Regarding the safety analysis, part of it is integrated into the Hot Cell building engineering ITER_D_SW5UFF - Technical Specification Hot Cell Complex - Building Engineering Contract, n parallel, a Safety framework contract has been put in place for complementary analysis.
The requested work is focused on design activities and cost optimization, knowing that these optimizations shall not downgrade the safety features of the facility.

6.2 Objective of the contract

The objective of this contract is to focus the effort on the building design activities, in close relation with the systems, aiming at managing the interfaces and reducing the cost as much as possible.

Main activities are described as followed:

- to manage properly all the interfaces between the building and the systems, starting from the beginning of the Hot Cell building engineering activities in order to prevent any risk of claims from the consortium in charge of this design activity… up to the end of this contract for which the Interfaces Sheets between the building and the different PBS will have to be updated. Indeed, the “process equipment datasheet” is part of the Hot Cell engineering contract, but the overall process of updating the Interface Sheets on IDM, iterating with the systems as needed to get them fully reviewed and approved document will have to be done within the activities specified in the current document. This activity includes also a tracking of exchanges between IO and the Hot Cell engineering contractor in order to prevent any risk of contractual claim due to unclear or too vague input data.

- to investigate, during the building design activities and the process design activities, ways to minimize the overall cost of the Hot Cell Complex, in term of investment cost and in term of operational cost.

It means that during this contract duration, the IO-CT will be working with a Third Party contractor on the engineering design of the Hot Cell Complex. The present contractor will follow and report to the IO on progress made by this Third Party in the above areas, and will provide feedback to the Third Party contractor on behalf of the IO-CT. This is the reason why the required skills (see section 9) shall correspond to expertise in building design activities, safety, Radwaste, remote handling and contract management.

6.3 Interfaces

Interface Control Document (ICD) and Interface Sheets (IS) between the buildings and processes to be integrated correspond to the following reference documents:

- [REF 1.] to [REF 4.] for the remote Handling Systems PBS 23,
- [REF 5.] to [REF 10.] for the Radwaste process PBS 66,
- [REF 11.] and [REF 12.] for the Port plug Test Facility PBS 58,
- [REF 13.] and [REF 14.] for the Air Detritiation System PBS 32,

The interfaces between the HCC buildings and the “In Vessel and Port Cell equipment” are presented in [REF 15.] to [REF 24.]. Interfaces are missing with Fueling (PBS18), Vacuum Cryopump (PBS31), Electron Cyclotron Heating (PBS52) and neutral Beam (PBS53), the ICD have been created recently and they will be under review on IDM for the start of the contract.
The interfaces between the HCC buildings and the “Control System” are presented in [REF 25.] to [REF 42.].

The interfaces between the HCC buildings and the plant systems and services (Power supply PBS43, Cooling water PBS26, Radiological monitoring PBS64, Access Control PBS69) are in [REF 43.] to [REF 68.]. Regarding cable trays (PBS44) and Assembly (PBS22), they are in [REF 69.] to [REF 76.].

The IDM links are the following:

Interfaces with PBS22
6.4 Cost optimization

The first part of this activity is to extensively participate to the trade-off studies performed by the building Engineering company (please refer to WP01 described in ITER_D_SW5UFF - Technical Specification Hot Cell Complex - Building Engineering Contract), extending the scope to the overall facility, including the process.

The goal is then to pursue this cost optimization during design and safety analysis activities, aiming at reviewing the technical options, the safety demonstration, identifying ways to minimize the cost without jeopardizing the requirements (functional and safety).

Goal is to share with third parties a tracking table of opportunities and options to be investigated in close relation with the teams in charge of the building and the process design. The aim is also to reduce major risks that have been identified. This activity shall include analysis and comparison between different options, based on lessons learned and feedback from existing technologies wildly used in nuclear field.

7 Responsibilities

7.1 Contractor’s Responsibilities

In order to successfully perform the tasks in these Technical Specifications, the Contractor shall:

• Strictly implement the IO procedures, instructions and use templates;
• Provide experienced and trained resources to perform the tasks;
• Contractor’s personnel shall possess the qualifications, professional competence and experience to carry out services in accordance with IO rules and procedures;
• Contractor’s personnel shall be bound by the rules and regulations governing the IO ethics, safety and security IO rules.

7.2 IO’s Responsibilities

The IO shall:

•Nominate the Responsible Officer to manage the Contract;
• Organise a monthly meeting(s) on work performed;
• Provide offices at IO premises.

9 Acceptance Criteria

These criteria shall be the basis of acceptance by IO following the successful completion of the services. These will be in the form of monthly progress reports as indicated in section 8, table of deliverables and further detailed below:

- Report and Document Review criteria.
- Reports as deliverables shall be stored in the ITER Organization’s document management system, IDM by the Contractor for acceptance. A named ITER Organization’s Contract Technical Responsible Officer is the Approver of the delivered documents.
- The Approver can name one or more Reviewers(s) in the area of the report’s expertise.
- The Reviewer(s) can ask modifications to the report in which case the Contractor must submit a new version.
- The acceptance of the document by the Approver is the acceptance criterion.
- The acceptance criteria of the document correspond to:
  - Justified and documented comments,
  - Lessons learned of existing nuclear facilities,
  - Reference to existing technologies and proven solutions used in nuclear field,
  - Reference to existing and applicable Norms and Standards,

10 Specific requirements and conditions

- Significant experience in the design of nuclear facility, in particular Hot Cells, dealing with complex interfaces,
- Significant experience in contract management of nuclear projects,
- Experience in Radwaste processing,
- Experience in Robotic, cranes and Remote Handling Systems

11 Work Monitoring / Meeting Schedule

The work will be managed by means of Progress Meetings and/or formal exchange of documents transmitted by emails which provide detailed progress. Progress Meetings will be called by the ITER Organization, to review the progress of the work, the technical problems and the planning. It is expected that Progress Meeting will be held weekly or biweekly. Progress meetings will involve C-R, CTROs, IO-RO and IO-TROs.

The main purpose of the Progress Meetings is to allow the ITER Organization/RHRM Division and the Contractor Technical Responsible Officers to:

   a) Allow early detection and correction of issues that may cause delays;
   b) Review the completed and planned activities and assess the progress made;
   c) Permit fast and consensual resolution of unexpected problems;
   d) Clarify doubts and prevent misinterpretations of the specifications.

In addition to the Progress Meetings, if necessary, additional meetings to address specific issues to be resolved may be requested by the ITER Organization.
For all Progress Meetings, a document (the Progress Meeting Report) describing tasks done, results obtained, blocking points and action items must be written by the Contractor. Each report will be stored in the ITER IDM in order to ensure traceability of the work performed.

12 Delivery time breakdown
See Section 8 – Deliverables and Due Date

13 Quality Assurance (QA) requirements
The organisation conducting these activities should have an ITER approved QA Program or an ISO 9001 accredited quality system.

The general requirements are detailed in ITER Procurement Quality Requirements (ITER_D_22MFG4).

Prior to commencement of the task, a Quality Plan must be submitted for IO approval giving evidence of the above and describing the organisation for this task; the skill of workers involved in the study; any anticipated sub-contractors; and giving details of who will be the independent checker of the activities (see Procurement Requirements for Producing a Quality Plan (ITER_D_22MFMW)).

Documentation developed as the result of this task shall be retained by the performer of the task or the DA organization for a minimum of 5 years and then may be discarded at the direction of the IO. The use of computer software to perform a safety basis task activity such as analysis and/or modelling, etc. shall be reviewed and approved by the IO prior to its use, in accordance with Quality Assurance for ITER Safety Codes (ITER_D_258LKL).

14 CAD Design Requirements (if applicable)
For the contracts where CAD design tasks are involved, the following shall apply:

The Supplier shall provide a Design Plan to be approved by the IO. Such plan shall identify all design activities and design deliverables to be provided by the Contractor as part of the contract.

The Supplier shall ensure that all designs, CAD data and drawings delivered to IO comply with the Procedure for the Usage of the ITER CAD Manual (2F6FTX), and with the Procedure for the Management of CAD Work & CAD Data (Models and Drawings 2DWU2M).

The reference scheme is for the Supplier to work in a fully synchronous manner on the ITER CAD platform (see detailed information about synchronous collaboration in the ITER GNJX6A - Specification for CAD data production in ITER Contracts.). This implies the usage of the CAD software versions as indicated in CAD Manual 07 - CAD Fact Sheet (249WUL) and the connection to one of the ITER project CAD data-bases. Any deviation against this requirement shall be defined in a Design Collaboration Implementation Form (DCIF) prepared and approved by DO and included in the call-for-tender package. Any cost or labour resulting from a deviation or non-conformance of the Supplier with regards to the CAD collaboration requirement shall be incurred by the Supplier.
15 Safety requirements

ITER is a Nuclear Facility identified in France by the number-INB-174 ("Installation Nucléaire de Base").

For Protection Important Components and in particular Safety Important Class components (SIC), the French Nuclear Regulation must be observed, in application of the Article 14 of the ITER Agreement.

In such case the Suppliers and Subcontractors must be informed that:

- The Order 7th February 2012 applies to all the components important for the protection (PIC) and the activities important for the protection (PIA).
- The compliance with the INB-order must be demonstrated in the chain of external contractors.
- In application of article II.2.5.4 of the Order 7th February 2012, contracted activities for supervision purposes are also subject to a supervision done by the Nuclear Operator.

For the Protection Important Components, structures and systems of the nuclear facility, and Protection Important Activities the contractor shall ensure that a specific management system is implemented for his own activities and for the activities done by any Supplier and Subcontractor following the requirements of the Order 7th February 2012 [20].

- Building structure. Volume about 300,000 m$^3$ nuclear concrete building  
- Approximately 600 rooms within the Hot Cell Complex,  
- Building systems, e.g. Heating, Ventilation, and Air Conditioning (HVAC), fire protection, electrical distribution, Instrumentation & Control (I&C), liners, red zone cooling, piping,  
- Mechanical heavy handling, e.g. cranes, doors, trolleys |
| **Numbers of hot cells / red zones** | 15 different hot cells in HCB, in total volume of red zones / C4 ventilation class = 26,000 m$^3$ |
| **Management of irradiated and contaminated components** | Contact dose rate = 250 Sv/h due to activation in the Tokamak.  
Contamination of tritiated and activated dust on In Vessel components and IRMS  
Constant efforts to prevent spread of dust in red zones (from design stage to operational procedures), ALARA |
| **Tritiated environment** | High level of tritium concentration > 4000 DAC (Derived Atmospheric Contamination) in red zones  
Red zone / C4 areas fully covered by stainless steel liner, with a gap between the concrete wall and the liner. This gap is maintained under air Detritiation System. |
| **Nuclear maintenance** | 10 different hot workshops, 300 m$^2$ average each, dealing with hands-on maintenance on components after remote decontamination, ALARA |
| **Remote heavy handling in red zone** | Handling of various heavy components, non-exhaustive list:  
- Equatorial Port Plug (50t, 3.5m length x 2.4 m x 2m),  
- Upper Port Plug (25t, 6 m length),  
- Divertor (9t, 3.5m length, 2m high, 0.8m wide),  
- Vacuum Cryopump (2.9m length, 1.7m diameter), |

| Treatment of radioactive solid waste | Orders of magnitude during 20 years operation:  
- 1000 tons of MAVL waste  
- 100 tons FMA-VC  
- 100 tons purely tritiated waste  
- 10 tons TFA |
| Treatment of radioactive liquid effluent | Orders of magnitude: 200 m³ / year |
| Radwaste process remotely controlled | Type B radwaste process located in the red zones / C4 areas shall be fully remotely controlled (no man access) and with in situ remote maintenance or hands-on maintenance after remote decontamination. |
| Complex remote operation | Port Plug refurbishment, example of tasks to be performed fully remotely:  
- tilting 90° of 50t port plugs,  
- removal of subcomponents,  
- welding and control,  
- testing. |
| Hot Cell Remote Handling | Design and integration of:  
- Tens of heavy duty long range manipulators, fully powered by electrical motors,  
- Few telescopic power manipulators,  
- Shielded windows,  
- Lighting and viewing systems,  
- Frames and handling tools,  
Buffer storage, remote decontamination, hands-on maintenance. |
| Centralized control system | Functions such as ventilation management, remote transfers, remote refurbishment of In Vessel Components, remote waste treatment, shall be controlled from a centralized control room located in the Personal Access Control Building |
| Seismic requirement | High seismic requirement (2 to 3 g acceleration in different dimensions) on building structure and part of the building system and process which is seismic classified according to the safety analysis |
